

# Cybersecurity explained for normal people

A web cybersecurity platform with accessible training for young people aged 18 to 29. By levels, and with no jargon.

Marmitako Group · Product presentation · Nazaret, 2026

# What we will cover

01

## The problem

Why young people fall for online scams.

02

## Solution and audience

What Ziber is, who it is for, its goals and how it makes money.

03

## Technical side

The technologies we chose, how it is built and how we keep it secure.

04

## Demo

A walkthrough of the working app.

01

# The problem

We live online, but almost nobody has taught us how to protect ourselves.

# Highly exposed, poorly prepared

Young people use their phones for everything: banking, shopping, social media and work. Scammers know it, and they tailor their tricks to them.

## Scams that look real

Emails, texts and websites that copy banks, delivery firms or Netflix. One rushed click is enough to lose an account or money.

## Lack of training

People aged 18–29 need accessible cybersecurity training, and almost nobody offers it to them.

## No starting point

Many people do not know where to start or what to learn first.

## Scattered resources

Information is split across forums, videos and random websites, with no order for beginners.

## Too technical or expensive

Existing courses are built for professionals: full of jargon, long and priced beyond a student budget.

## Low visibility

Cybersecurity talks and events get very little promotion, so young people never hear about them.

# 02

## Solution and audience

Ziber: one platform that brings everything together and explains it for beginners.

# One place to learn cybersecurity

A single, centralised web platform with cybersecurity courses, guides and talks for young people aged 18 to 29.

## Courses

Original content in three levels: beginner, intermediate and advanced. Practical and short.

## Guides

Practical readings and downloadable resources adapted to the digital world young people live in.

## Talks

A calendar of events and webinars, in collaboration with people from the industry.

✓ Free to start

✓ Built for beginners

✓ Spanish and English

✓ Individuals and schools

# Learn by doing

Original content by levels, plus tools to train your eye, in Spanish and English.

24

## Courses

From beginner to advanced: passwords, phishing, networks, encryption, pentesting...

20+

## Phishing Test

Checks any link and tells you which red flags it has, in plain language.

8

## Quiz

"Legit or phishing?" questions, with an explanation for every answer.

2

## Languages

The whole site in Spanish and English, with a single button.

BEGINNER

Passwords, phishing  
and safe habits

INTERMEDIATE

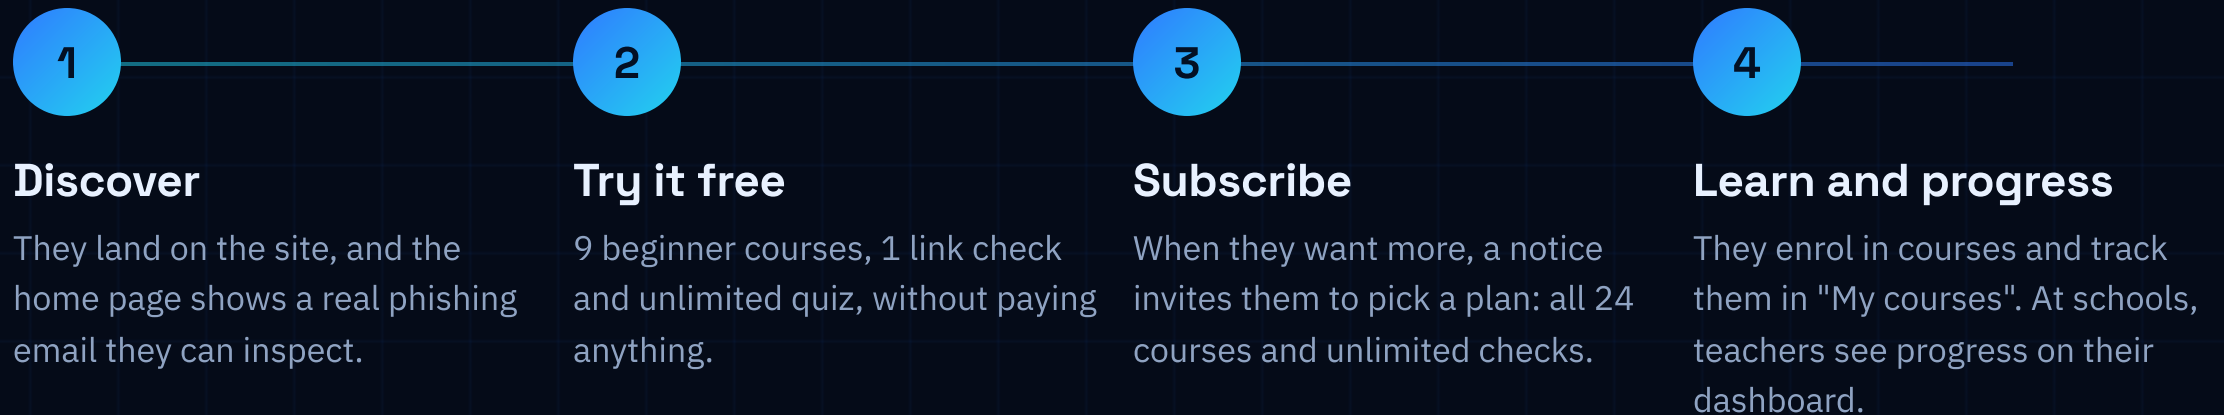

Networks, encryption  
and common attacks

ADVANCED

Vulnerabilities and  
incident response

# From curiosity to subscription

Users try enough for free to see the value, and a subscription unlocks the rest.

# Young people aged 18 to 29

Digital natives who use technology every day, but who were never taught to use it safely.

- Sixth-form, vocational and university students — the first to get scams about grants, parcels or purchases.
- First jobs and first bank accounts — more money at stake and more fake "official" emails.
- They shop online and live on social media — fake shops, stolen accounts, rigged giveaways.
- They learn with short, practical formats — no 300-page manuals.

## Individuals

They want to protect themselves. They start on the free plan and move to a monthly or yearly subscription.

## Schools

Secondary schools, vocational centres and universities that want to train their students. One subscription per school, with a dashboard for teachers.

# What users get

## Centralised access

Everything on a single platform, with no need to search through multiple sources.

## Structured learning

Content organised by levels, so it is easier to understand and to follow.

## Practical content

Up-to-date resources adapted to the real digital world.

## Time savings

No more hunting for scattered information across dozens of websites.

## Improved employability

Cybersecurity skills are highly sought after in the industry.

## Access to events

Talks and webinars with industry professionals.

# Freemium for people, licences for schools

## Individuals

| PLAN    | PRICE            | INCLUDES                                   |
|---------|------------------|--------------------------------------------|
| Basic   | <b>Free</b>      | 9 beginner courses, 1 link check, quiz     |
| Monthly | <b>€9.99</b> /mo | 24 courses, unlimited checks, certificates |
| Yearly  | <b>€79</b> /yr   | Everything above + live talks (save 34%)   |

## Schools

| PLAN      | PRICE             | INCLUDES                                           |
|-----------|-------------------|----------------------------------------------------|
| Classroom | <b>€290</b> /yr   | 1 class (30 students), dashboard for 1 teacher     |
| School    | <b>€1,490</b> /yr | 300 students, all levels, progress reports         |
| Network   | <b>Custom</b>     | Several schools, joint dashboard, teacher training |

Sample MVP prices. Schools can request a 30-day free trial.

# What we commit to

01 Launch the platform with three working sections in **less than six months**

02 Publish at least **15 educational resources** during the first six months

03 Reach **1,000 registered users** during the first year

04 Organise or promote at least **10 talks or events** during the first year

05 Achieve a **satisfaction rate above 80%** in user surveys

# 03

## Technical side

How Ziber is built, and why we built it this way.

# A modern, lightweight stack

Only two production dependencies. Fewer moving parts means a faster, safer site that is easier to maintain.

## Vue 3

The UI framework. Reusable components (course cards, quiz, user menu) and reactivity.

## Vue Router

Page navigation without reloads. Guards the private areas: My courses, My subscription and the teacher dashboard.

## Vite

Development and build tool. Instant reload while we code, and an optimised build for production.

## Node.js

Our own server on the native `http` module, no frameworks: login, courses and dashboard API, and it serves the site.

## Google Safe Browsing

Google's list of dangerous websites. Queried from the server so the API key is never exposed.

## pnpm + Git

A fast package manager, and team version control with one branch per task.

# How the pieces fit together

## Frontend

*What the user sees*

Vue 3   Vue Router   Vite

- Home, Courses, Phishing Test and Subscriptions
- Login, My courses and My subscription
- Teacher dashboard
- Spanish / English translations

↔  
JSON

## Backend

*System logic · REST API*

Node.js   Safe Browsing

- POST /api/login · /logout
- GET /api/yo → who is logged in
- GET·POST·DELETE /api/mis-cursos
- GET /api/panel → teachers only
- POST /api/revisar → link check

↔  
files

## Data

*Data storage*

JSON files   → SQLite

- Users, with plan and role
- Course enrolments
- Demo data for the teacher dashboard
- Courses and plans, in the code

The MVP has no database yet. The next step is SQLite.

# A detector that explains what it sees

<https://paypa1-seguro.xyz/login/verifica-cuenta>

Every link is checked against more than 20 rules. Each red flag adds points, and the total gives the verdict:

**Privacy:** the check runs in the user's browser. Google is only asked if it is enabled, and always through our server.

- Brand impersonation — ~30 banks, shops and public bodies with their official domains
- Look-alike characters — paypa1, g00gle, arnazon ("rn" for "m")
- One letter changed — Levenshtein distance
- The @ trick, an IP instead of a domain, foreign alphabets
- Risky extensions (.xyz, .top...), URL shorteners and free hosting
- Bait words — login, verify, account, fine...
- Executable downloads and double extensions (.pdf.exe)

# Secure by design

## MAIN DATA

### Users

Email, name, plan and role

### Enrolments

The courses each student has joined

### Courses

24 courses in both languages

### Plans

Individual and school subscriptions

### Classroom data

Sample progress for the dashboard

## SECURITY MEASURES

### Password hashing

`scrypt` from Node's crypto module, never plain text

### Secure sessions

`HttpOnly` cookie signed with HMAC: it can't be read or forged

### Brute-force protection

Login attempts limit, and the same error for any wrong email or password

### Role management

Student, subscriber and teacher, checked on the server, not just hidden

### Secrets on the server

API keys in `.env`, kept out of Git and never sent to the browser

# Feasible today, ready to grow

**The MVP is already built and running with the resources we have today.**

## Familiar technology

JavaScript from end to end (Vue in the browser, Node.js on the server): one language for the whole team.

## Low cost

Every tool is free or open source: Vue, Vite, Node.js, pnpm, GitHub and Google Safe Browsing. It runs on any static hosting.

## Scalability

We start with JSON files and add a database (SQLite), payments and new content step by step.

## Minimal risk

Only two production dependencies and a tested stack, so there is little risk of getting stuck.

# 04

## Demo

A walkthrough of the app, exactly as a user sees it.

# Where we are heading

## Today

A working MVP with 24 courses, the Phishing Test, the quiz, subscription plans and a teacher dashboard, in two languages.

24

courses

20+

phishing rules

2

languages

## Next version

- Real payments and invoices
- A database (SQLite) instead of files
- Open sign-up for new users
- Certificates when a course is finished
- Downloadable guides and live talks

## CONCLUSION

# Why Ziber is worth building

- ✓ The project is **useful, feasible and highly scalable** in the future.
- ✓ The functional MVP has been **built during Helsinki Week**.
- ✓ This analysis justifies developing a **longer-term project during the next academic year**.

# Thank you!
